1. Product & Why I Chose This Direction

Nemesis Interiors is my own startup/product idea, created as an AI-powered interior redesign and visual shopping platform.

I chose to build Nemesis Interiors for **Part 2 — The Premium Home Page** because it gave me an opportunity to design a product around a strong visual problem: turning an ordinary room photograph into a personalized, photorealistic interior while making the resulting furniture and decor discoverable and shoppable.

The core product flow is:

Upload a room → Choose a style → Generate the redesign → Discover furniture → Shop

I intentionally designed the homepage around this workflow instead of creating a generic AI SaaS landing page. The hero immediately demonstrates the transformation through a before/after room experience, while the following sections progressively introduce AI restyling, architectural preservation, style exploration, computer-vision hotspots, and the product editor.

The visual direction is inspired by premium architecture and interior-design publications combined with modern AI-product interfaces. I used a dark, restrained palette with warm champagne accents, editorial typography, large interior photography, generous whitespace, and subtle motion to create a feeling of **quiet luxury rather than a typical AI startup website**.

2. Trade-off

The biggest trade-off was between **visual richness and implementation scope**.

There are many interactions that could be added to a product like Nemesis Interiors, but I prioritized the interactions that communicate the product's core value: the before/after transformation and the shoppable hotspots.

Instead of filling the homepage with animations, statistics, testimonials, or decorative effects, I focused on product visualization and restrained motion.

With a full production timeline, I would further develop the shopping experience, improve the connection between the marketing page and the design editor, optimize image delivery, and expand accessibility and cross-device testing.

3. AI Tools & My Involvement

I used AI tools throughout the development process to explore visual directions, generate interior-design reference imagery, iterate on UI concepts, and accelerate parts of the frontend implementation.

AI-generated output was treated as a starting point rather than a finished solution. I reviewed and refined the resulting layouts, typography, spacing, responsive behavior, interactions, and visual hierarchy, and connected the design to the actual Nemesis product concept.

I also intentionally avoided fabricated testimonials, user counts, customer logos, ratings, and unsupported performance claims. Since Nemesis Interiors is an early-stage product concept, I chose to communicate its value through the product experience itself rather than inventing social proof.

4. Design Principles

- **Show, don't claim:** demonstrate the product through real UI and interactions.
- **Premium over excessive:** prioritize typography, whitespace, photography, and composition over visual effects.
- **Product-first storytelling:** move the visitor through upload → restyle → discover → shop.
- **Meaningful motion:** use animation to improve interaction and continuity rather than decoration.
- **Responsive by design:** intentionally support both 390px mobile and 1440px desktop.
- **Honest presentation:** no fabricated testimonials, statistics, logos, or social proof.
- **Ownership:** every major design and implementation decision is something I can explain and defend.

5. Technology

The website is built with:

- React
- TypeScript
- Vite
- Tailwind CSS
- Lucide React
- Lenis

The broader Nemesis Interiors concept also uses Google's Gen AI ecosystem and Firebase for AI generation, authentication, and persistence.
